**DETAILED ACTION**

***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1-6 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 1 recites the limitations "the pushing force" in line 7 and "the non-circular cross section" in line 11. There is insufficient antecedent basis for these limitations in the claim.

Claim 4 recites the limitations "the pushing force" in line 8 and "the non-circular cross section" in line 13. There is insufficient antecedent basis for these limitations in the claim.

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1,2,4 and 5 are and rejected under 35 U.S.C. 102(b) as being anticipated by Rolin et al. (4,509,351). Rolin discloses a metal spinning method for forming a work of a metal sheet (column 3, line 44) by pushing the work onto a rotating mandrel (5)

using a forming roller (6). Driving actuators (12,13,14) receive feedback signals from a force sensor (22) (column 4, lines 40-42 and column 5, lines 22-31) to control a pushing force of the forming roller (6). The work is formed into a tapered (non-circular) cross section by following an outline of the tapered mandrel (5). A motion of the forming roller is stored (column 5, lines 59-62) from past spinning workings and a rotational speed of a motor for rotating the mandrel is controlled (column 6, line 6). Rolin discloses a jig (3,4,) for clamping the work between the mandrel and jig. Rolin discloses movement of the roller along axes a,b.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 3 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rolin et al. (4,509,351) in view of Okamoto et al. (JP 59-061529). Rolin does not disclose that the forming roller is fed in a direction of the axis of rotation of the mandrel. Okamoto teaches a forming roller (4) that is tilted in a direction of an axis of rotation of a mandrel (1). It would have been obvious to one skilled in the art at the time of invention to position the forming roller of Rolin at a tilted angle along the axis of rotation of the mandrel as taught by Okamoto in order to start the work at a desirable forming angle.

***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Any inquiry concerning this communication should be directed to Ed Tolan whose telephone number is 571-272-4525. FAX communications should be sent to 571-273-8300.
